SUMMARY

Product Owner / Business Analyst with hands-on experience translating ambiguous operational needs into structured workflows, business rules, approval flows, and management-facing systems. Experienced across requirement discovery, stakeholder alignment, process mapping, UAT facilitation, delivery coordination, and iterative product improvement. Previously acted as de facto Product Owner and sole BA for two internal enterprise platforms at Kalbe Nutritionals — bridging business stakeholders and technical implementation across multiple entities without a formal PM or BA layer.

EXPERIENCE

Fullstack Developer (Acting as sole Product Owner & Business Analyst)

PT Sanghiang Perkasa, Kalbe Nutritionals — Contract · Nov 2024 — May 2026 · Jakarta, Indonesia

- Owned end-to-end product discovery and delivery for two internal enterprise platforms from business need identification, requirement elicitation, workflow design, and system specification through UAT facilitation, stakeholder validation, and iterative improvement without a PM or senior BA as intermediary.
- Elicited and consolidated cross-departmental requirements by collaborating strategically with the Management System PIC as the central proxy translating multi-function inputs from FA, HCD, Procurement, QFS, PPIC, SHE, and External Supply Chain across three manufacturing entities into structured system specifications.
- Prioritized features based on direct operational feedback: starting with core submission-approval workflow, iterating to add under-target monitoring, audit trail, Best Estimate, and Trend PDCA Analysis as needs evolved.
- Designed an authorization model decoupling authentication (IT-controlled) from permission management (Management System-controlled) reducing operational dependency on IT for day-to-day access changes.
- Navigated complex organizational dynamics, cross-functional dependencies, and compressed UAT timelines while maintaining delivery progress across two platforms simultaneously.
- Supported stakeholder-facing materials and product positioning for MsDigi's Board-level presentation.
- Translated informal operational context received as high-level descriptions of how each department works into structured requirements, system specifications, approval flows, and data governance rules.

PROJECTS

Ms Digi — Multi-Entity KPI Governance & Performance Management Platform

Performance visibility · KPI governance · Multi-entity · Dimensional RBAC · Decision support · Board-level

- Designed and built a company-wide KPI governance platform adopted as the single source of truth across three manufacturing entities — PT Sanghiang Perkasa, Kalbe Morinaga Indonesia, and Kalbe Milko Indonesia covering FA, HCD, EXT, PROC, WH RMPM, QFS, PPIC, WHL, SHE and MS
- Governed 71 KPIs with cross-entity read visibility and entity-scoped write control implementing dimensional access control (role × department × entity) to enable organizational transparency while maintaining data integrity across entities.
- Served as the central KPI consolidation hub aggregating performance data from direct departmental input and downstream systems (including departments with their own KPI tracking workflows), establishing MsDigi as the authoritative source for Board-level Management Review.
- Defined system scope, user roles, approval flows, and data governance rules from scratch using only an Excel spreadsheet as the initial business input — covering departments with distinct internal and external reporting lanes (including vendor, supplier, and toll manufacturer access for KPI reporting within the governance framework).
- Drove platform adoption from a data entry tool into a Decision Support System actively used in monthly Management Review across three entities — proving the platform's native operational efficiency and value when compared to generic external tools like Tableau.
- Iteratively expanded capability based on direct operational feedback: Best Estimate, Trend PDCA Analysis, under-target monitoring, audit trail, and delegated permission management added across the product lifecycle.

Ecalmas — Calibration Management System

Legacy reconstruction · .NET 10 · Role-based Access · Embedded Analytics · UAT delivered in 1 month

- Led requirement reconstruction of a legacy calibration system through reverse engineering of 37 undocumented legacy tables preserved full workflow fidelity while modernizing the system foundation, delivering UAT within one month.
- Replaced an existing Tableau implementation with a purpose-built embedded analytics dashboard after identifying that the use case covered only basic aggregations the application layer could already handle natively reducing external tool dependency.

SKILLS

Product & Ownership: Product lifecycle management, backlog prioritization, requirement elicitation, stakeholder alignment, user story writing, iterative delivery, product thinking

Business Analysis: Process mapping, gap analysis, workflow design, business rules documentation, system specification, data governance, UAT facilitation

Systems: System decomposition, RBAC design, multi-tenant architecture, service boundary design, auditability, Clean Architecture

Technical: .NET, C#, SQL Server, JavaScript, React, Next.js, Redis, Docker, Jenkins

EDUCATION

Universitas Bina Sarana Informatika

Bachelor's Degree in Information Systems · GPA: 3.72 / 4.00 · 2021 – 2025 · Jakarta, Indonesia
